Innovation und Technologie

# Overview

## State-of-the-art

- Technology milestones
- Technology overview
- Overview dimensioning

## Recent Innovations

- Combustion technology
- System integration
- Co-production

## Innovation Impacts

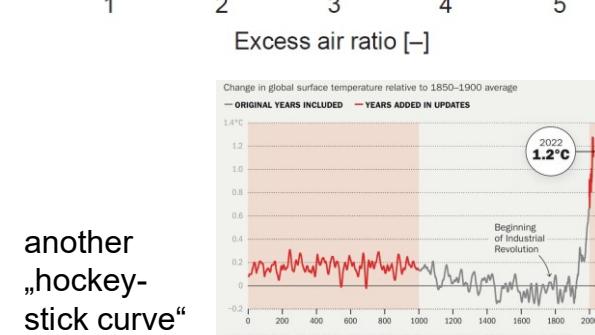

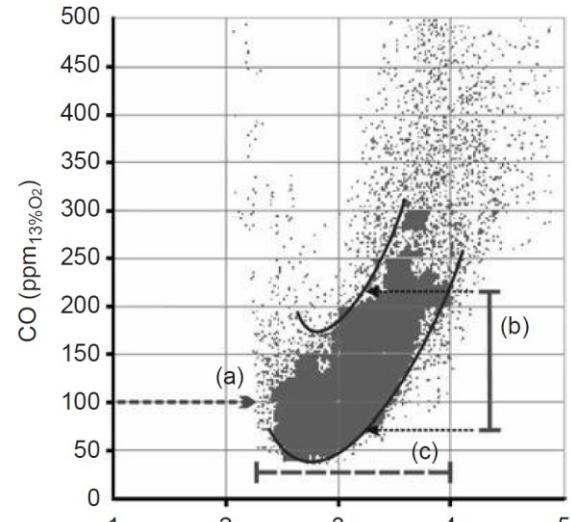

## Conclusions

# Introduction

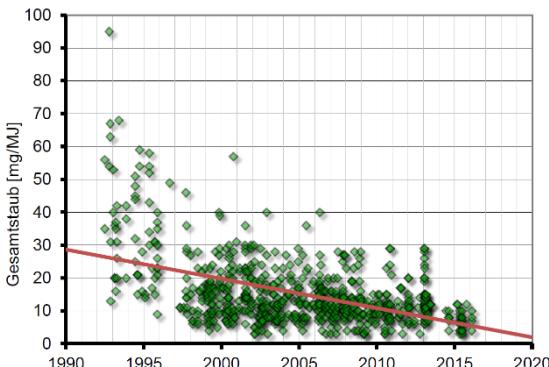

- All information presented (and more) is included in an upcoming IEA Bioenergy Task 32 report
- Residential biomass boiler technology is looking back to more than 40 years of development
- For a long time the main innovation focus was on reducing emissions and increasing efficiency
  - Standardisation, both of technology and testing procedures was crucial
- **Technologies shown in the presentation are just examples, there are many more available!**

# State-of-the-art – Technology overview

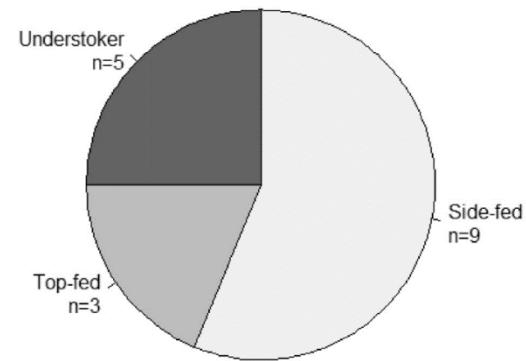

Technologies by approved fuel

Pellet boilers by feeding system

Woodchips boilers by feeding system

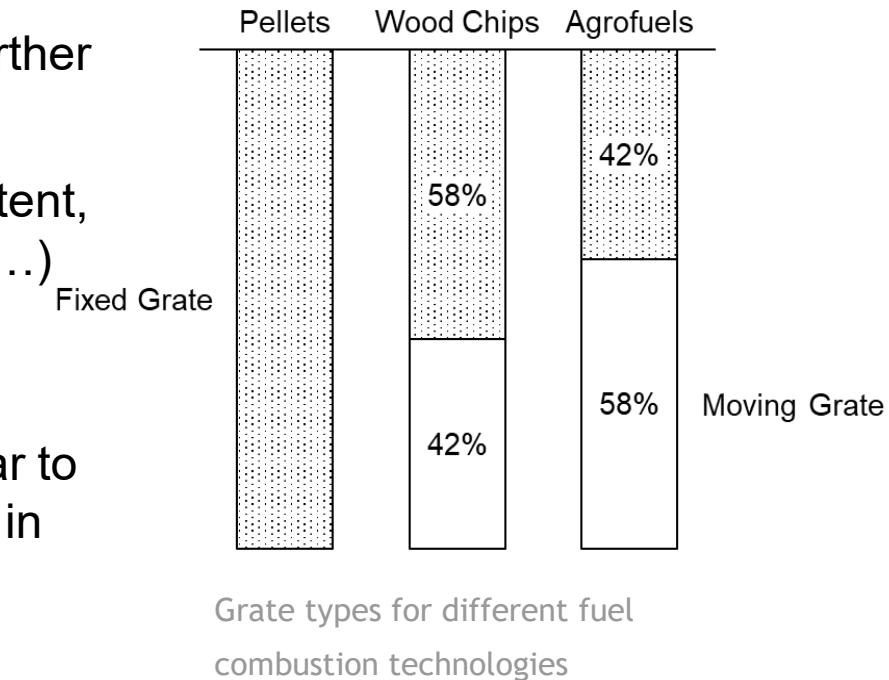

**Survey of 76 commercially available residential biomass combustion appliances**

Source: Sabine Feldmeier, Markus Schwarz, Elisabeth Wopienka, Christoph Pfeifer, **Categorization of small-scale biomass combustion appliances by characteristic numbers**, Renewable Energy, Volume 163, 2021, Pages 2128-2136, ISSN 0960-1481,  
<https://doi.org/10.1016/j.renene.2020.10.111>.

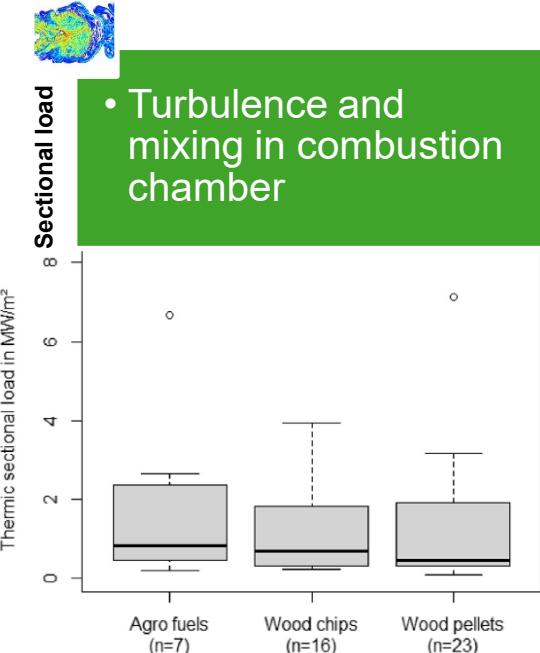

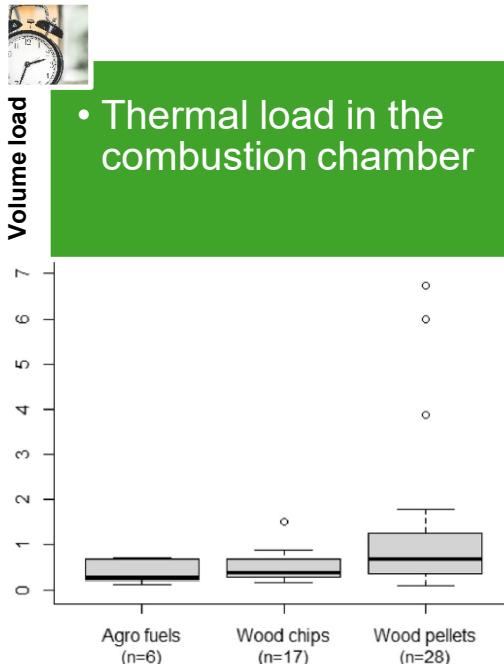

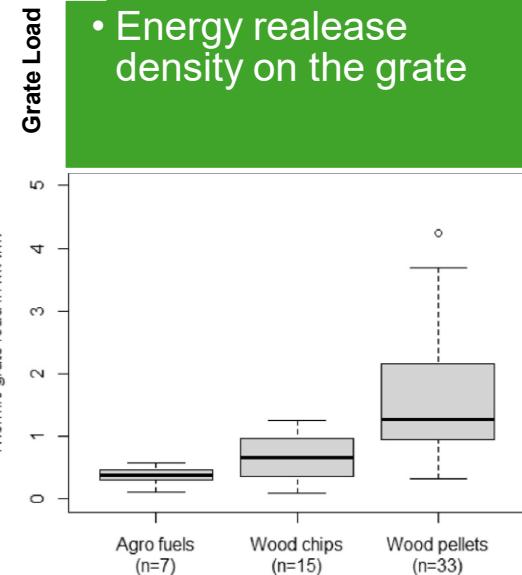

# State-of-the-art – Grate type

- Selection of grate-type defines the further system dimensioning process
- Challenging (cheaper) fuels (ash content, slagging properties, size distribution,...) place higher demands on grate technology
- Even high-tech grate solutions (similar to large scale combustion plants) found in residential boiler today

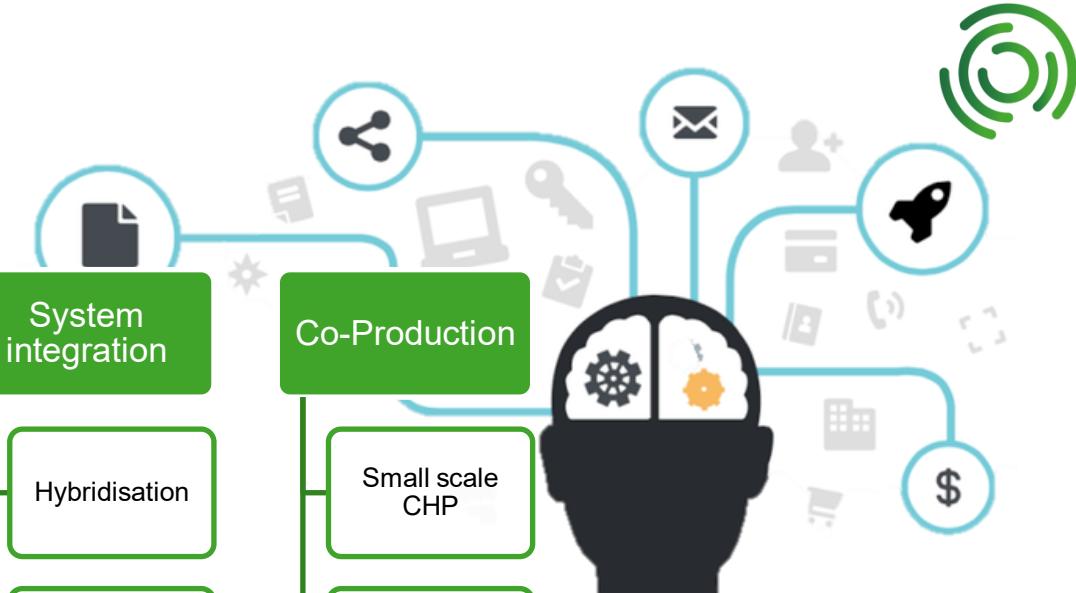

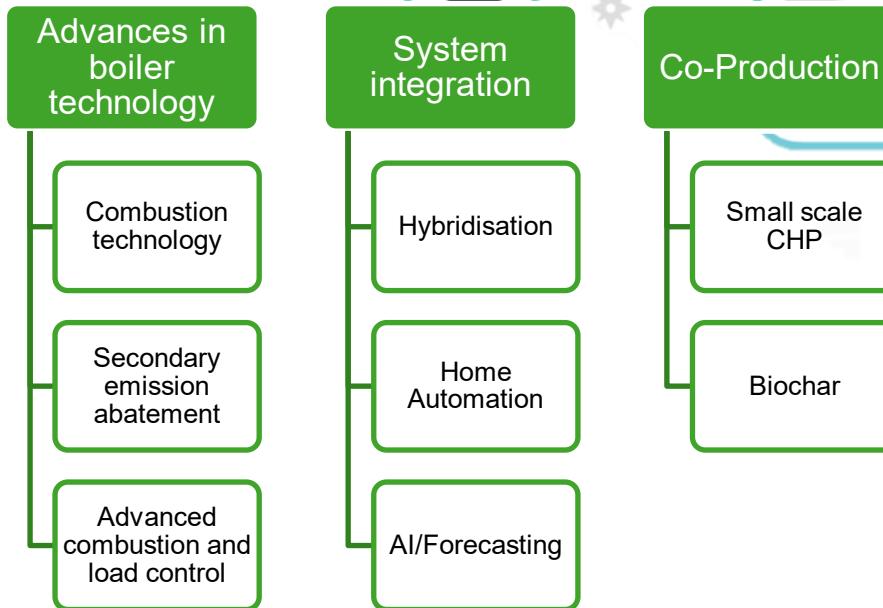

# State-of-the-art – Dimensioning

Source: Sabine Feldmeier, Markus Schwarz, Elisabeth Wopienka, Christoph Pfeifer, **Categorization of small-scale biomass combustion appliances by characteristic numbers**, Renewable Energy, Volume 163, 2021, Pages 2128-2136, ISSN 0960-1481, <https://doi.org/10.1016/j.renene.2020.10.111>.

# Recent innovations

# Latest innovations – Boiler technology

## Combustion technologies

- Further development of air staging concept
- Pyrolysis/gasification separated from gas combustion
- Temperature/lambda control in the fuel bed → reduced volatilisation of inorganic species
- Well mixed gas combustion zone

Gasifier Technology

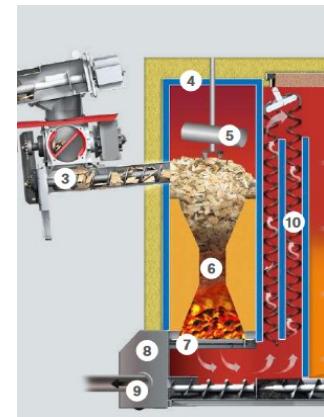

updraft

# Latest innovations – Boiler technology

## Combustion technologies

### Flameless combustion

Pellematic Compact by Ökofen,  
zero flame technology

Source: <https://www.oekofen.com/de-at/pellematic-compact/>

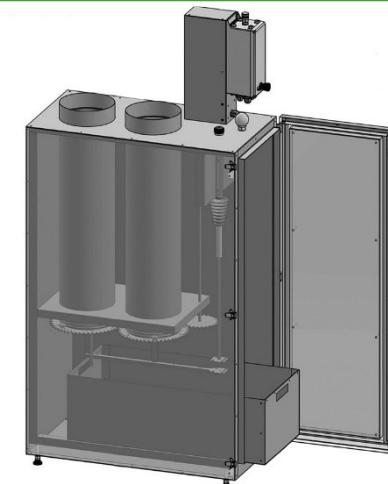

- Similar concept as gasifier technology: pyrolysis and volatilisation → gas phase combustion
- Flue gas recirculation to control temperature of the fuel bed
- Injection of preheated secondary air in the gas combustion zone (almost no flames visible)

# Latest innovations – Boiler technology

## Emission abatement

- Secondary abatement as alternative or add-on to advanced combustion concepts
- Several emission abatement technologies have been tested for resident applications
- Electrostatic precipitators (ESP) “won” the race:
  - Good separation efficiency for all particle sizes
  - Low pressure drop (= operation costs)
- Market implementation either as standalone device (also for retrofitting)

Retrofit and modular electrostatic precipitation

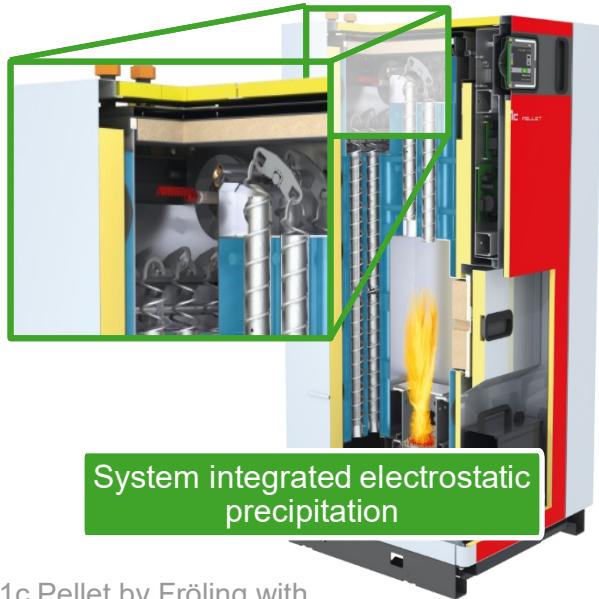

HERZ Elektrofilter

# Latest innovations – Boiler technology

## Emission abatement

PE1c Pellet by Fröling with integrated electrostatic precipitator

Source: <https://www.froeling.com/de-de/produkte/pellets/neu-pe1c-pellet/>

- or integrated into the boiler system
- Advantages:
  - Easy „communication“ between boiler and EPS (on control unit)
  - Boiler heat exchanger can be used for particle separation
- Challenges / Cons:
  - No retrofitting possible
  - Finding the right place for installation of electrode (temperature / moisture restrictions)

# Latest innovations – Boiler technology

## Advanced combustion- and load-control

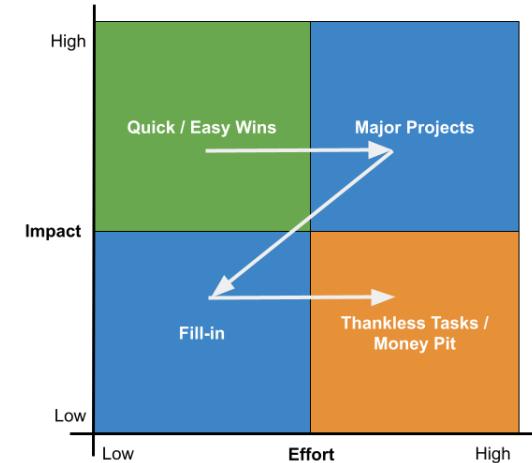

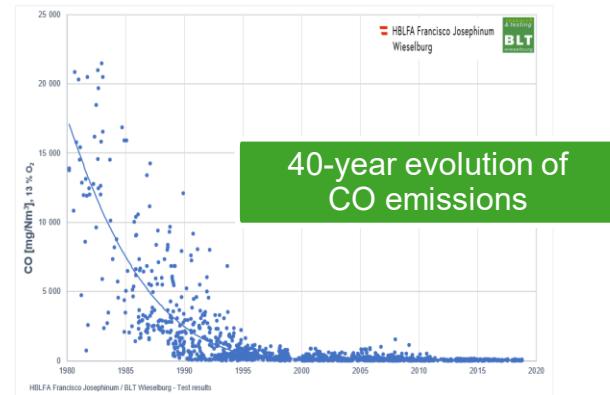

- Modern combustion technology is almost at the optimum (limits) of primary combustion conditions (temperatures, excess air ratio, mixing,...)
- Advanced control solutions required:
  - Adaptive control (e.g. with fuel quality online measurement)
  - Model-based control (using mathematical models predicting the reaction of the boiler)
  - Weather-forecasting for load control

# Wrap-up: Combustion Technology

- Modern biomass combustion technologies are approaching their zero-emission goals, while
- Measurement methods are approaching their limits of determination (e.g. dust)
- Further improvement is possible BUT with very small impact at a high price („thankless tasks“)
- Extremely low emissions and maximum efficiency are becoming “state-of-the-art”
  - Fields of innovations have broadened

# Lastest innovations – System integration

## Hybridisation

### Biomass combustion & Solar thermal

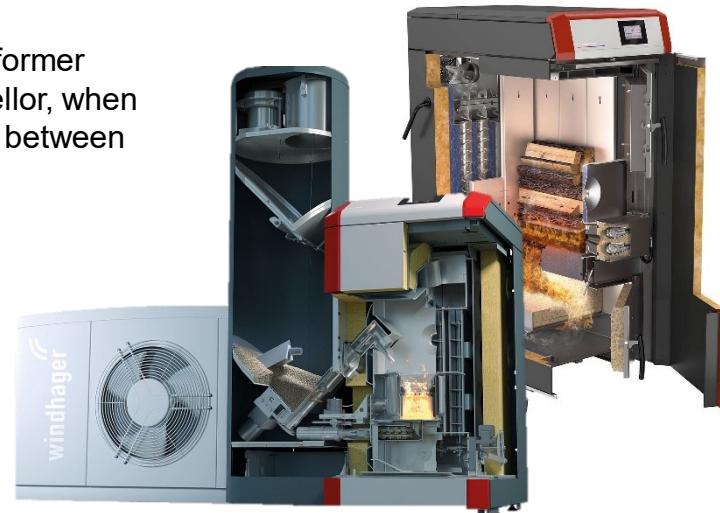

Solarfocus ecotop<sup>zero</sup> with CPC - solar collector  
Source: [https://www.solarfocus.com/en/products/solar-system/cpc-panels?\\_ptp=12](https://www.solarfocus.com/en/products/solar-system/cpc-panels?_ptp=12)

“Combining the best of two worlds”

(quote: Sebastian Kurz, former Austrian Federal Chancellor, when announcing the coalition between ÖVP and Green Party)

- Mostly useful on an energy perspective
- Economics are sometimes a bit tricky
- **Sector coupling is an opportunity**

### Biomass combustion & Heat pump

# Innovation impacts

Impact on	Boiler technology			System integration			Co-production	
	Combustion technology	Advanced controls	Emission abatement	Hybrid-system	Home Automation	KI / Forecasting	CHP	Biochar
Energy efficiency	+	+	+	o	o	o		
Emission reduction	+	+	+	+				
Cost effectiveness	o	o		+	+	+	+	+
Sector coupling				+	+	+	+	+
User friendliness					+	+		
Carbon sequestration								+
Circular economy								o

# Conclusions

- Residential biomass boiler technology is **highly developed** (“mature” technology)
- Emission and efficiency requirements for **incentives** are still drivers for development, BUT the impacts addressed in the innovations have become more versatile
- System integration includes people: Boilers are becoming more “**user-centric**”
- New co-production concepts open potentials for residential applications in **circular economy and carbon sequestration**
- **μCHP systems** have been developed, but market is still hesitant (economics)

## Residential Biomass Boiler Systems
